

ASX Release

AML Clinical Trial Update – Conference call with Principal Investigator

Melbourne, Australia (20 April 2017): Clinical-stage oncology company Prescient Therapeutics Ltd (ASX: PTX) is pleased to announce it will host a conference call for investors to provide an overview and update of its current Phase 1b trial of PTX-200 in Acute Myeloid Leukemia (AML).

The overview will be provided by globally renowned cancer researcher Professor Said Sebti, Chief Scientific Officer of Prescient Therapeutics Ltd, and the Principal Investigator, Professor Jeffrey Lancet, Chair of the Department of Malignant Hematology at the H. Lee Moffitt Cancer Center. The call will include a live question and answer session.

The call will be held at:

Australia: 8.15am AEST Friday 28th April 2017

US PST: 3.15pm Thursday 27th April

US EST: 6.15pm Thursday 27th April

About Prescient Therapeutics Limited (PTX)

PTX is a clinical stage oncology company developing novel compounds that show promise as potential new therapies to treat a range of cancers that have become resistant to front line chemotherapy.

PTX's lead drug candidate PTX-200 inhibits an important tumor survival pathway known as Akt, which plays a key role in the development of many cancers, including breast and ovarian cancer, as well as leukemia. Unlike other drug candidates that target Akt inhibition which are non-specific kinase inhibitors that have toxicity problems, PTX-200 has a novel mechanism of action that specifically inhibits Akt whilst being comparatively safer. This highly promising compound is now the focus of three current clinical trials. The first is a Phase 1b/2 trial evaluating PTX-200 as a new therapy for relapse and refractory Acute Myeloid Leukemia, being conducted at Florida's H. Lee Moffitt Cancer Center (Moffitt) and Yale Cancer Center in New Haven, Connecticut (Yale) under the leadership of Professor Jeffrey Lancet, MD.

PTX is also conducting a Phase 2 study examining PTX-200 in breast cancer patients at the prestigious Montefiore Cancer Center in New York and the Moffitt. The third trial is a Phase 1b/2 trial of PTX-200 in combination with current standard of care is also underway in patients with recurrent or persistent platinum resistant ovarian cancer at the Moffitt.

PTX's second novel drug candidate, PTX-100, is a first in class compound with the ability to block an important cancer growth enzyme known as geranylgeranyl transferase (GGT). It also blocks the Ral and Rho circuits in cancer cells which act as key oncogenic survival pathways, leading to apoptosis (death) of cancer cells. PTX-100 was well tolerated and achieved stable disease in a Phase I trial in advanced solid tumors.
